Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes.

It is a useful tool to helps teams better understand their users.

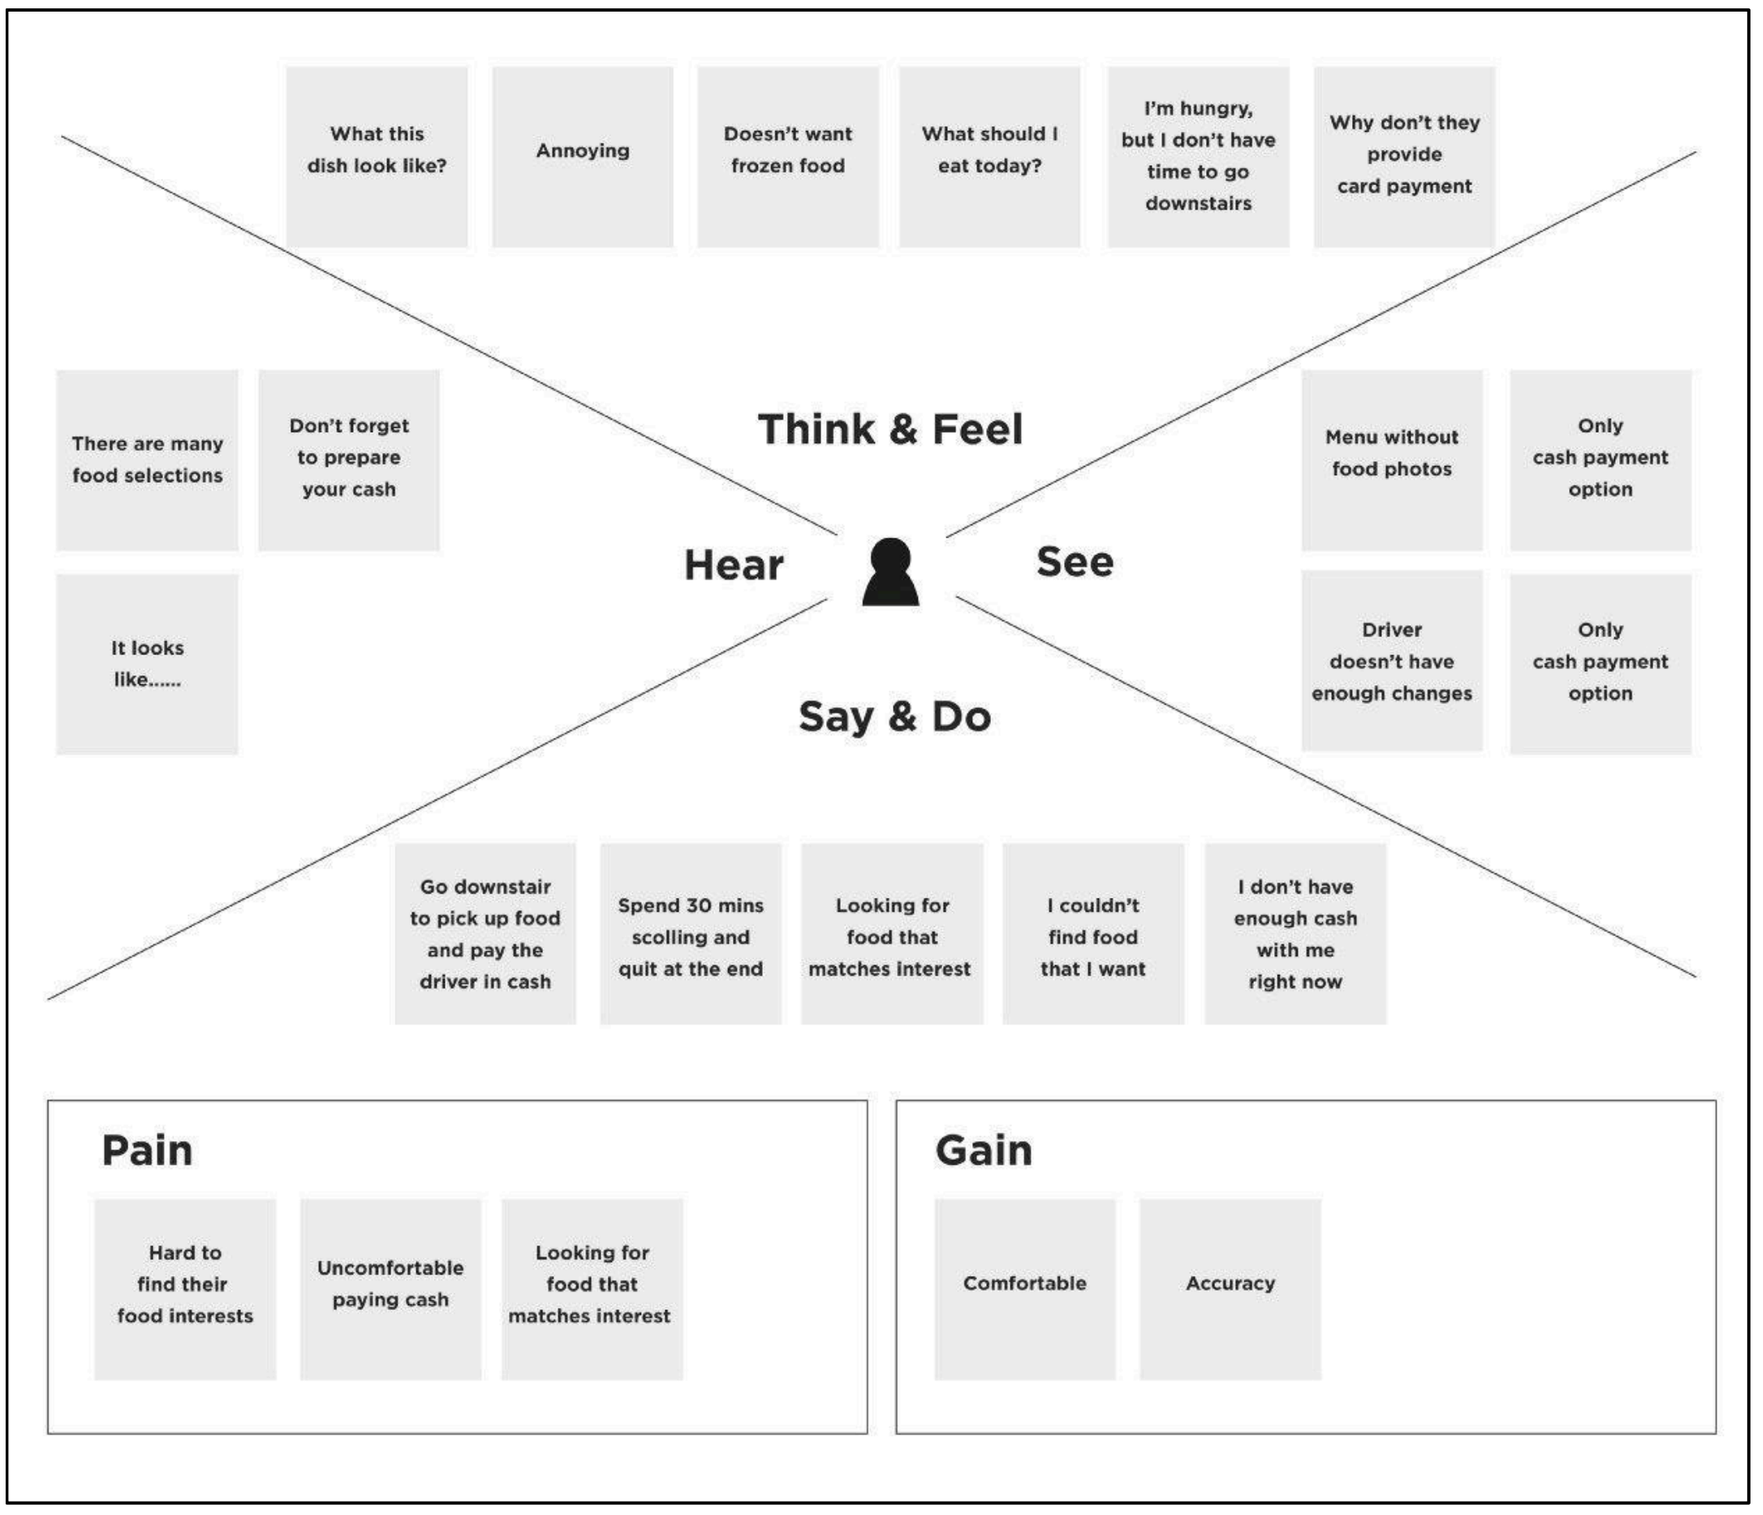

Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Project-Specific Empathy Map Content:

Example: Script-Controlled ACL – Restrict Record Access Based on Field Value

USER / ROLE

System Administrator / Authorized User

SAYS

"Users should only access records that they are permitted to view."

"Access should change automatically when the field value changes."

THINKS

"Static access rules may not be sufficient for dynamic record restrictions."

"The ACL should securely evaluate field values before granting access."

DOES

Configures ACL rules, updates record field values, tests access permissions, and monitors whether users can access the correct records.

FEELS

Concerned about unauthorized access and data exposure, but wants a simple and reliable way to enforce dynamic record-level security.

PAINS

Unauthorized record visibility; manually maintaining access rules; inconsistent permissions when field values change; difficulty testing dynamic access conditions.

GAINS

Dynamic access control, improved record security, automatic restriction based on field values, easier administration, and controlled access for authorized users.

GOALS / NEEDS

Restrict record access according to field values; evaluate conditions through script-controlled ACL logic; ensure only authorized users can view or modify records.
